Total surgically treated population	171
Case mix description for the total surgically treated population	171
Postonerative mortality for the total surgically treated population	172

## 1. Introduction and patient selection

### 1.1. Project background

This report includes data that have been delivered by recognised medical centres to the Belgian Cancer Registry for the three years of the RIZIV/INAMI convention regarding the reimbursement of complex surgery for benign, premalignant and malignant conditions of the pancreas and/or periampullary region. All patients considered for complex surgery at a multidisciplinary consult (MC) at an expert centre were included. For the patients for whom it was decided not to perform complex surgery only the descriptives were analysed. There are 3 major types of surgical indications: malignant tumours, benign tumours and non-tumoural conditions. The report is subdivided in 2 chapters: tumoural and non-tumoural pathology.

For details on the calculation of the indicators, see document 'Complex Surgery - Pancreas Reading guide v2.0 (14/02/2020)'. After the third convention year the indicator 'completeness of registration' will include all the data of the three convention years, including delayed/adjusted data deliveries.

#### 1.2. Data selection criteria

All data from registrations by recognised expert centres sent to the Belgian Cancer Registry were included if:

- In case of surgery: date of surgery 1/07/2019 30/06/2022.
- In case of no surgery: date of MC 1/07/2019 30/06/2022.

#### Remark:

- Foreign patients were not included in the data selection criteria.
- In case that the same patient was registered by two different hospitals, the registration was assigned to the centre where the surgery was performed.
- In case that the same patient was registered by two different hospitals without any surgery, the registration was assigned to the centre where the first MC took place.
- In case that the same patient had multiple separate surgeries during the convention period, the different registrations were assessed individually to determine which registration was retained for the report.
- Registrations sent by collaborating hospitals were counted among those of the main expert centre within their collaboration.

# 2. General overview of registered patients

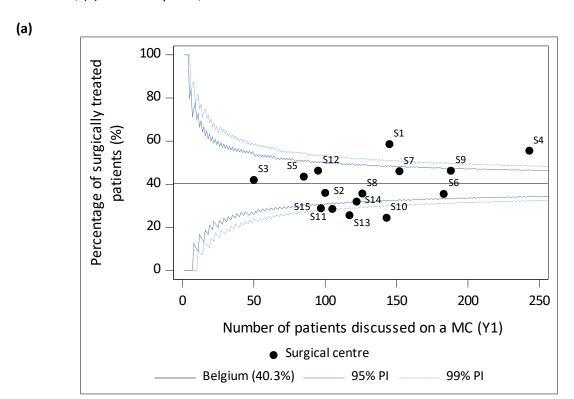

**Table 1.** Number of patients discussed on a multidisciplinary consult (MC), distribution of indication type by surgery type and by expert centre.

<sup>\*\*</sup> Patients could have received a combination of treatments listed, thus the total number of treatments could be larger than the total number of patients.

## 3.1.2. Completeness of registration

The indicator 'completeness of malignant cases' assesses for how many patients with malignant tumours surgery was performed in the third convention year and how many of these patients were actually registered in the complex surgery database. These data are based on information that was extracted from the pathology reports from all Belgian laboratories for Pathological Anatomy.

Minimum target value: >= 95% for the third convention year.

**Table 4.** Completeness of **malignant** cases: Total number of patients with performed surgeries registered by expert centre in the third convention year.

	Belgium, recognised centres			
	n registered	N performed	n/N (%)	
N patients with surgery in Year 3	739	739	100.0	
Expert centres				
S1	78	78	100.0	
S2	25	25	100.0	
S3	26	26	100.0	
S4	121	121	100.0	
S5	30	30	100.0	
S6	82	82	100.0

### 3.2. Process indicators

## 3.2.1. Time between diagnosis and start of treatment

Normally this time frame is calculated between the date of anatomopathological confirmation (incidence date) and start of treatment. But since not all tumours can be confirmed histologically before surgical treatment, we will divide this indicator into 2 parts:

- For all patients: time between *suspected* diagnosis and start of treatment. The date of suspected diagnosis is the date of the first diagnostic method (CT, MRI, PET, PET/CT, ERCP, EUS, surgery, ...). This is the date of the first discovery of a tumour or mass and not the confirmation of a malignancy or a more specific diagnosis.
- Only for patients with histological confirmation before surgical treatment: time between *confirmed* diagnosis and start of treatment.

Start of treatment is defined as the start of the primary oncological treatment, which can be any neoadjuvant treatment or surgery.

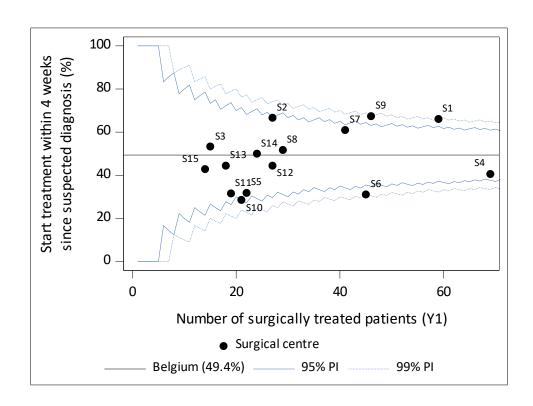

## 3.2.1.1. Time between suspected diagnosis and start of treatment for patients with (suspected) adenocarcinoma

**Table 6.** Proportion of surgically treated patients with **suspected adenocarcinoma** in the three convention years for whom treatment started within 4 weeks since suspected diagnosis.

	Belgium

Adjusted for age at diagnosis, sex, ASA score, Charlson Comorbidity Index, type of surgery, vascular resection/reconstruction and tumor type (as proposed by the Belgian Pancreatic Cancer Group).

This table shows the case-mix adjusted odds ratio for postoperative mortality within 30 days and the center specific direct standardized 30-day mortality (%), together with their accompanying 95% confidence intervals. The 'average patient' odds ratio and direct standardized result are weighted averages of the individual centre results with the fraction of patients per centre as weights. The 'average patient' results for the case-mix adjusted odds ratio and the direct standardized mortality serve as references and enable comparison of the individual center results with the reference. An individual center result is significantly different from the average result if the average result is not included in the center specific confidence interval.

The postoperative mortality probability was modelled using a logistic regression model. All the possible two-way interaction terms between the case-mix variables were evaluated during the model building procedure. The quality of the regression was assessed taking into account the deviance as well as Pearson goodness-of-fit and the Hosmer and Lemeshow goodness-of-fit test, and the residual plots were examined for potential influential points and resolved when needed.

**Figure 15:** Standardised probability for the 30-day postoperative mortality in the three convention years, by surgical centre.

S15	1.89	[0.96, 3.71]	1.05	9.2	[5.0, 16.4]	5.4

Adjusted for age at diagnosis, sex, ASA score, Charlson Comorbidity Index, type of surgery, vascular resection/reconstruction and tumor type (as proposed by the Belgian Pancreatic Cancer Group).

This table shows the case-mix adjusted odds ratio for postoperative mortality within 30 days and the center specific direct standardized 30-day mortality (%), together with their accompanying 95% confidence intervals. The 'average patient' odds ratio and direct standardized result are weighted averages of the individual centre results with the fraction of patients per centre as weights. The 'average patient' results for the case-mix adjusted odds ratio and the direct standardized mortality serve as references and enable comparison of the individual center results with the reference. An individual center result is significantly different from the average result if the average result is not included in the center specific confidence interval.

The postoperative mortality probability was modelled using a logistic regression model. All the possible two-way interaction terms between the case-mix variables were evaluated during the model building procedure. The quality of the regression was assessed taking into account the deviance as well as Pearson goodness-of-fit and the Hosmer and Lemeshow goodness-of-fit test, and the residual plots were examined for potential influential points and resolved when needed.

**Figure 17:** Standardised probability for the 90-day postoperative mortality in the three convention years, by surgical centre.

#### **3.3.2.** Survival

Survival indicators 3 and 5 years after surgery cannot yet be calculated since there is only a limited number of patients with a 3-year follow-up after surgery at the time the report was made and no patients with a 5 year follow-up. The vital status used in these analyses was determined on the 19<sup>th</sup> of October 2022.

## 3.3.2.1. Unadjusted observed survival after surgery (all causes of death) for malignant and benign tumours

**Table 17.** Number of events, total person years, hazard and 95%CI, during the first year interval after surgery for **malignant and benign tumours**, in the three convention years.

### 3.3.3. Proportion of surgically treated patients with resection margin R0, R1, R2

**Table 22.** Proportion of surgically treated patients with **pancreatic ductal adenocarcinoma** in the three convention years with resection margin R0, R1 and R2.

	Belgium					
Resection margin	N	n	n/N (%)	95% CI		
Total surgically treated patients with pancreatic ductal adenocarcinoma	858					
Convention year						
Year 1	245					
Year 2	322					
Year 3	291					
Resection margin status						
RO	858	569	66.3	[63.0, 69.5]		
- With simultaneous vascular resection		105				
- Without simultaneous vascular resection		464				
R1 indirect	858	203	23.7	[20.9, 26.6]		
- With simultaneous vascular resection		57				
- Without simultaneous vascular resection		146				
R1 direct	858	83	9.7	[7.8, 11.9]		
- With simultaneous vascular resection		31				
- Without simultaneous vascular resection		52				
R2	858	3	0.3	[0.1, 1.0]		
- With simultaneous vascular resection		1				
- Without simultaneous vascular resection		2				

R0: tumour-free resection margin > 1mm

R1 indirect: tumour-free resection margin <= 1mm

R1 direct: microscopic tumour involvement of the resection margin

R2: macroscopic tumour transection

Remark: Enucleation is regarded as a R1 resection

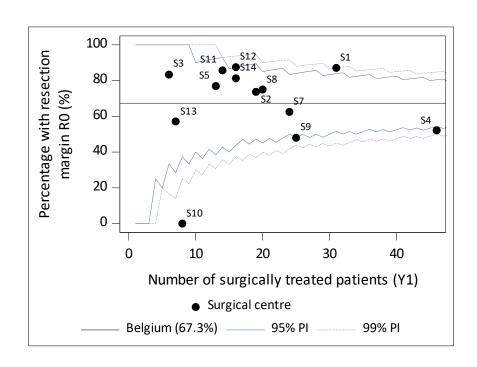

Remark: Reduced absolute number of patients is due to the specific selection of 'pancreatic ductal adenocarcinoma' (i.e.

ICD-O-3 selection applied: topography C25, morphology 8500/3)

Remark: Patients with R1 without specification direct or indirect were excluded from the table (N=5)

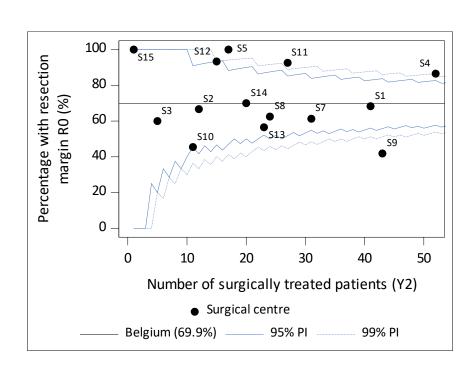

**Figure 18:** Funnel and spagnetti plot of the proportion of surgically treated patients with **pancreatic ductal adenocarcinoma** with resection margin **R0**, per centre, for (a) year 1, (b) year 2, (c) year 3, (d) all years combined, (e) evolution year 1, 2 and 3.

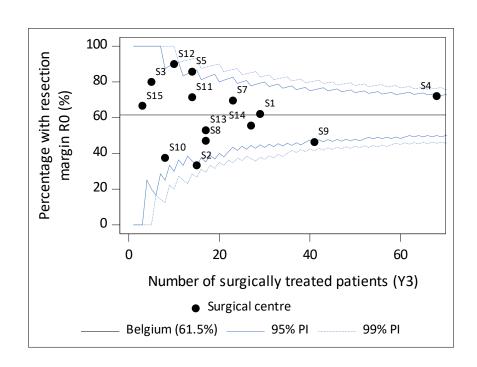

N=2 hospitals are not displayed in the graph above because they had no patients for the current selection.

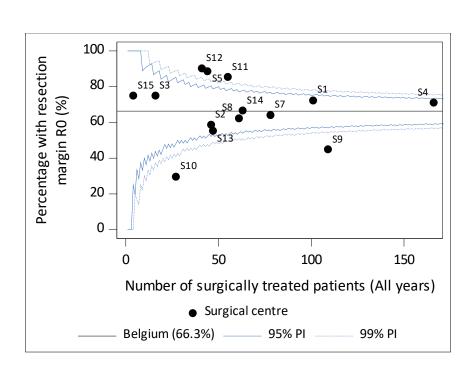

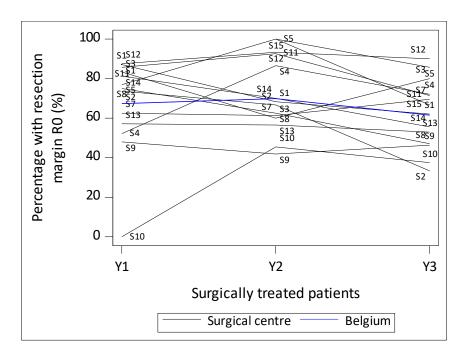

N=1 hospital is not displayed in the graph above because it had no patients for the current selection.

(d)

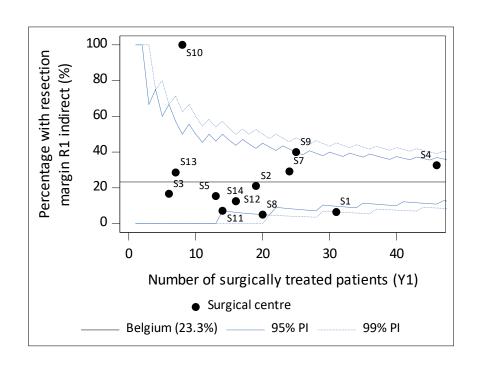

N=1 hospital is not displayed in the graph above because it had no patients for the current selection.

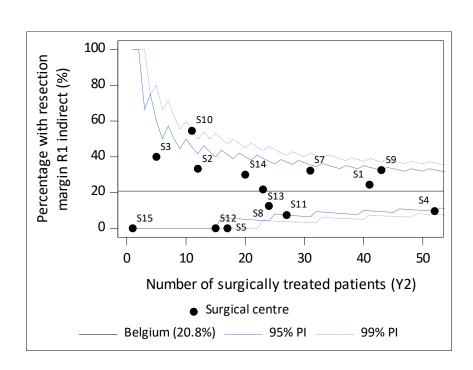

**Figure 19:** Funnel and spaghetti plot of the proportion of surgically treated patients with **pancreatic ductal adenocarcinoma** with resection margin **R1 indirect**, per centre, for (a) year 1, (b) year 2, (c) year 3, (d) all years combined, (e) evolution year 1, 2 and 3.

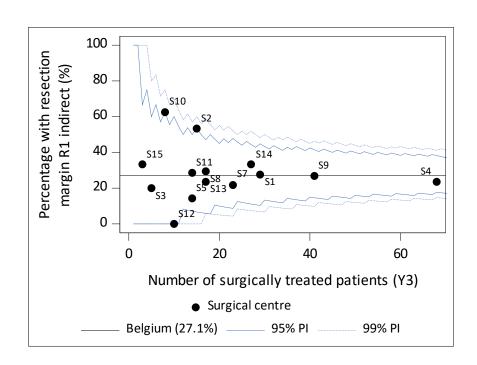

N=2 hospitals are not displayed in the graph above because they had no patients for the current selection.

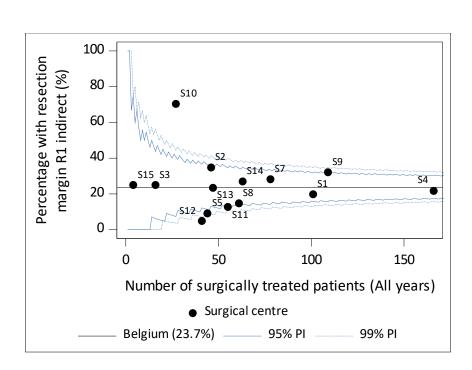

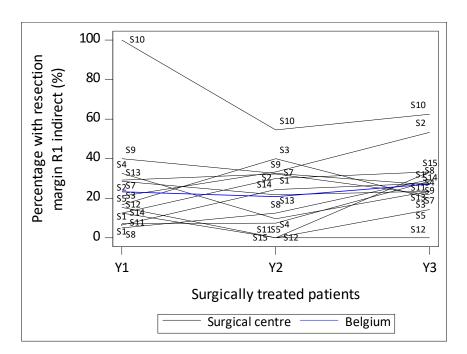

N=1 hospital is not displayed in the graph above because it had no patients for the current selection.

(d)

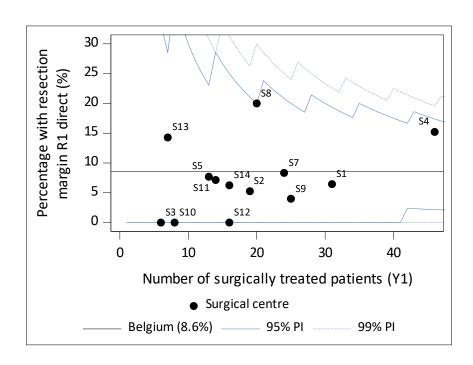

N=1 hospital is not displayed in the graph above because it had no patients for the current selection.

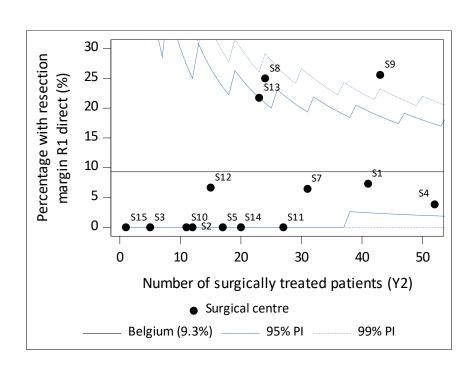

**Figure 20:** Funnel and spaghetti plot of the proportion of surgically treated patients with **pancreatic ductal adenocarcinoma** with resection margin **R1 direct**, per centre, for (a) year 1, (b) year 2, (c) year 3, (d) all years combined, (e) evolution year 1, 2 and 3.

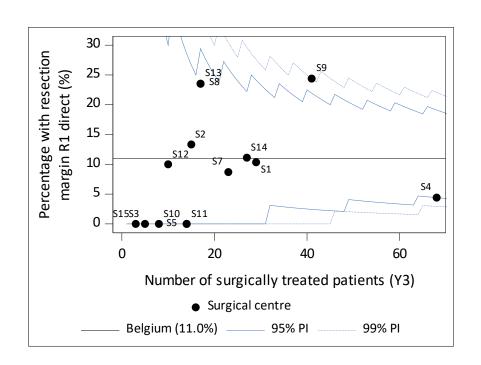

N=2 hospitals are not displayed in the graph above because they had no patients for the current selection.

## 4.1.2. Completeness of registration

The indicator 'completeness of registration forms' indicates for how many patients a fully completed dataset was received (including all requested complex surgery variables and textual reports).

Minimum target value: >= 95% for the third convention year.

**Table 27.** Completeness of registration forms: number of registrations in complex surgery database that were complete in the third convention year, by surgery type and by expert centre.

	Belgium				
Patient group	N registered	n complete	n/N (%)

#### 4.2. Process indicators

### 4.2.1. Length of stay in the expert centre

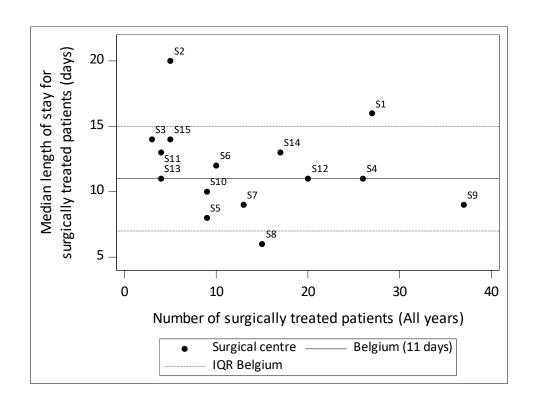

Table 28. Length of stay for patients surgically treated in an expert centre in the three convention years.

Belgium				
Лedian (days)	IQR*			
11	[7, 15]			
12	[9, 15]			
12	[7, 16]			
10	[7, 14]			
	10			

<sup>\*</sup> Interquartile Range= [the 25th, and 75th percentiles of the data]

Figure 36: Median length of stay for surgically treated patients, per centre, for (a) year 1, (b) year 2, (c) year 3, (d) all years combined.

(a)

#### 4.3. Outcome indicators

### 4.3.1. Postoperative mortality

#### 4.3.1.1. Unadjusted 30-day postoperative mortality

There were only 2 postoperative deaths observed for all hospitals combined (N=1 for Y1, N=1 for Y2 and N=0 for Y3), therefore no results are given.

### 4.3.1.2. Unadjusted 90-day postoperative mortality

There were only 5 postoperative deaths observed for all hospitals combined (N=3 for Y1, N=2 for Y2 and N=0 for Y3), therefore no results are given.

#### 4.3.2. Survival

### 4.3.2.1. Unadjusted 1-year observed survival after surgery (all causes of death)

There were only 11 all-cause deaths observed within the first year after surgery for all hospitals combined (N=6 for Y1, N=2 for Y2 and N=3 for Y3), therefore no results are given.

### 4.3.2.2. Unadjusted 1-year relative survival after surgery

There were only 11 all-cause deaths observed within the first year after surgery for all hospitals combined (N=6 for Y1, N=2 for Y2 and N=3 for Y3), therefore no results are given.

## 4.3.3. Proportion of surgically treated patients with surgical complications

Note that in-hospital is defined as the days the patient was hospitalised between the date of surgery and 90 days post-surgery.

**Table 29.** Proportion of surgically treated patients with surgical complications in the three convention years (90-day postoperative, in-hospital), by complication type.
